

2. (Amended) The method of claim 1, further comprising the step of selectively precluding a user from viewing a second screen subsequent to viewing a first screen until data is entered into said first screen.
3. (Amended) The method of claim 1, further comprising the a prefatory step of selecting between a plurality of levels of complexity for said will document, wherein each level of complexity requires less input data from said input screens.
4. (Amended) The method of claim 3, wherein there are said prefatory step comprises selecting among three levels of complexity.
5. (Amended) A software program for effecting a method of effecting an interactive process, wherein there are at least three levels of interaction one of which is selected by an end user, wherein said three levels comprise:
 - a first level wherein a user inputs a first data set to a plurality of data input sections, and a null entry is not permitted;
 - a second level of less complexity than said first level wherein said software program utilizes makes assumptions based on limited data input by an end user, wherein said limited data is less data than said first data set; and
 - a third level of less complexity than said second level wherein said software program selects between several pre-determined outputs based upon basic data input by an end user, wherein said basic data is less data than said limited data set.
6. (Amended) The software program of claim 6 5 wherein the interactive process is the process of generating a will.
7. (Amended) A method of effecting an interactive process for generating a will or trust document using a computing device comprising the steps of:
providing an initial data entry section wherein a user selects between two or more levels of data entry question complexity;
providing a subsequent plurality of data entry questions which differ based upon the level of data entry question complexity chosen, wherein the data entry questions to collect personal and financial data;
